

PRODUCT UPDATE

4WD DRIVESHAFTS

4WD driveshafts play a crucial role in transmitting power and torque from the differential to the wheels. The Constant Velocity, or CV joints featured in the majority of driveshafts are able to articulate and plunge to allow for steering and suspension travel. BW 4WD driveshafts are direct OE replacements, manufactured from high-quality materials. BW has a continuously expanding range of 4WD driveshafts from leading automotive manufacturers, available for purchase in Australia and New Zealand.

PRODUCT FEATURES

1. Matches fit, form and function of OE parts.
2. Engineered using high-quality materials.
3. Range caters for lifted vehicles.

WARRANTY

**Driveshafts 4WD,
Commercial Vehicles & Taxis**
1 year / 20,000km

TECH TIPS

COMMON DRIVESHAFT PROBLEMS

VEHICLE VIBRATION

May be caused by excessive wear of the CV joint or splines.

LOUD CV JOINT

A clicking noise when turning or accelerating often results from a worn CV joint.

A clunking noise when accelerating or decelerating is can indicate a worn inner CV joint with excessive backlash or clearance.

A humming noise can occur from a lack of lubrication in the CV joint.
